| KEYWORDS | Supercomputing, web portal, mediators |

EXECUTIVE SUMMARY

This deliverable provides the current design of the Portal accessible through the SoBigData++ platform for users to find the computing resources more suitable to their research objective, their availability and the administrative contacts to access them.

The work has been realized in the context of task “T9.5: Supercomputing Network management and access”, with the collaboration of the institutions providing computing resources to the project. This document is describing the design of the web tool to collect and publish the policies governing the access of the Supercomputing centres that constitute a network connected to the SoBigData++ infrastructure. Given the nature of the information and the heterogeneous procedures of the supercomputing centres involved, the role of institution mediator has been introduced, as a key part for the agile approach of the user to the Supercomputing centre selected.

The design presented in this deliverable is going to be implemented as a full operational tool in the next months, with a first prototype phase to be realized at short term, and a more complete version to be delivered according to the feedback received by the users on the prototype.

DISCLAIMER

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 871042.

SoBigData++ strives to deliver a distributed, Pan-European, multi-disciplinary research infrastructure for big social data analytics, coupled with the consolidation of a cross-disciplinary European research community, aimed at using social mining and big data to understand the complexity of our contemporary, globally-interconnected society. SoBigData++ is set to advance on such ambitious tasks thanks to SoBigData, the predecessor project that started this construction in 2015. Becoming an advanced community, SoBigData++ will strengthen its tools and services to empower researchers and innovators through a platform for the design and execution of large-scale social mining experiments.

This document contains information on SoBigData++ core activities, findings and outcomes and it may also contain contributions from distinguished experts who contribute as SoBigData++ Board members. Any reference to content in this document should clearly indicate the authors, source, organisation and publication date.

1 Relevance to SoBigData++

This document and the portal outcome are part of work package (WP) 9.

1.1 Purpose of this document

The purpose of this document is to provide the design of the Portal for the computing network of the project.

1.2 Relevance to project objectives

One of the main objectives of the project is the transnational access and the access to the project resources by users. The design and implementation of a portal will make the users' selection and the institution approach simple and effective, minimizing the reaction time from the user's selection of the institution to their effective access.

1.3 Relation to other work packages

Transnational access (WP6) modalities and information will be coordinated with T6.1

1.4 Structure of the document

The content of this deliverable has been organized in 4 sessions, that describe the objective of the portal, the role of the institution's mediators, the web portal design and the procedure to collect information and keep it up to date.

2 Objectives of the portal

The objectives of the portal are:

- Give support to the user in finding the appropriate computational resources
- Facilitate the matching between resource availability and the users' needs
- Facilitate the procedures to access the resources

The portal will collect the technical information the users will need to select the proper computing facility for running their jobs, and the administrative information with the contacts that will provide access conditions and facilitate the access process. While the selection of the institution to host the user's jobs will be a simple self-service, the access procedure will be followed by a person (Institution mediator) who will follow and guide the user in the approach of the administrative process.

2.1 Functionalities for the users

The design of the portal is based on the objectives of the portal itself. The information provided by each institution has to be displayed, as well as comparison tables, to find:

- Facility technical characteristics; information about the infrastructure of each center, type of computing machines, their processor type, and amount of memory.
- Updated availability of the resources; size, description and subject for each resource available. The list of resources is updated by each institution mediator.
- Administrative access mechanisms; information on both in person and virtual access terms.
- Technical information to use the computing resources; information on the services, systems and code supported by each center in order to access the resources.
- Direct link to the mediator of each institution; institutional personal email for each of the institution's mediators.

2.2 Role of the mediators

Each Institution that provides the possibility to use computing resources through the project has been asked to identify an Institution Mediator collaborating to T9.5. The list of mediators collected so far is reported in Annex A.

The Institution Mediator provides information and administrative support for the access procedure to the users. Mediators are invited to participate actively, providing content, collaborating with the user's support, and facilitating the user's bureaucratic process to access the provided facilities. The responsibility of the mediator is also to keep the resources available for its institution up to date.

3 Portal design

In the inception, the portal was thought to be designed as a web application or a website and then be deployed in the already existing infrastructure and link it in the SoBigData++ gateway. At this point, the web page creators would get the rights to edit and modify the pages as needed. However, once the portal is deployed, every center mediator needs to have editing rights and access to the page in order to keep their own information updated. This would mean that the page's contents would need to be within a CMS that provides a simple document editing GUI.

With the editing limitations presented above, the best option to accomplish the task's goals would be to create a wiki within the SoBigData++ gateway. The wiki would need to be publicly available without a specific login. In the future, all center mediators will need to have editing access since every center/mediator needs to be able to update his/her own information and the info related to their institution in the future.

A wiki within the SoBigData++ gateway is the solution that will more adequately accomplish the goals of the T9.5 task. A wiki can be a very efficient way to gather and distribute information. Anyone with the necessary editing rights can update their own information. The flexible structure of a wiki will allow us to adapt as the information itself changes, and will also allow the information within to grow into whatever possible future needs.

The template with the information that will be integrated for each institution can be found in Appendix B of this document.

3.1 Proposed Structure of the wiki

The main page will have a contents menu with five expandable sections. The first section will be named "Institutions," where the name of each institution that forms part of SoBigData++ will be displayed. When you click an institution name, the information contained in the template shown in Appendix B will open. All the institutions information will follow the same template.

In order to make facts comparisons easier to view for the user, the main menu will also have tabs for "Computing", "Storage", "Datasets", and "Mediators". The comparison tables will have information of specific elements of all the centers. Figures 3.1.1 - 3.1.5 report the views of the expected tabs.

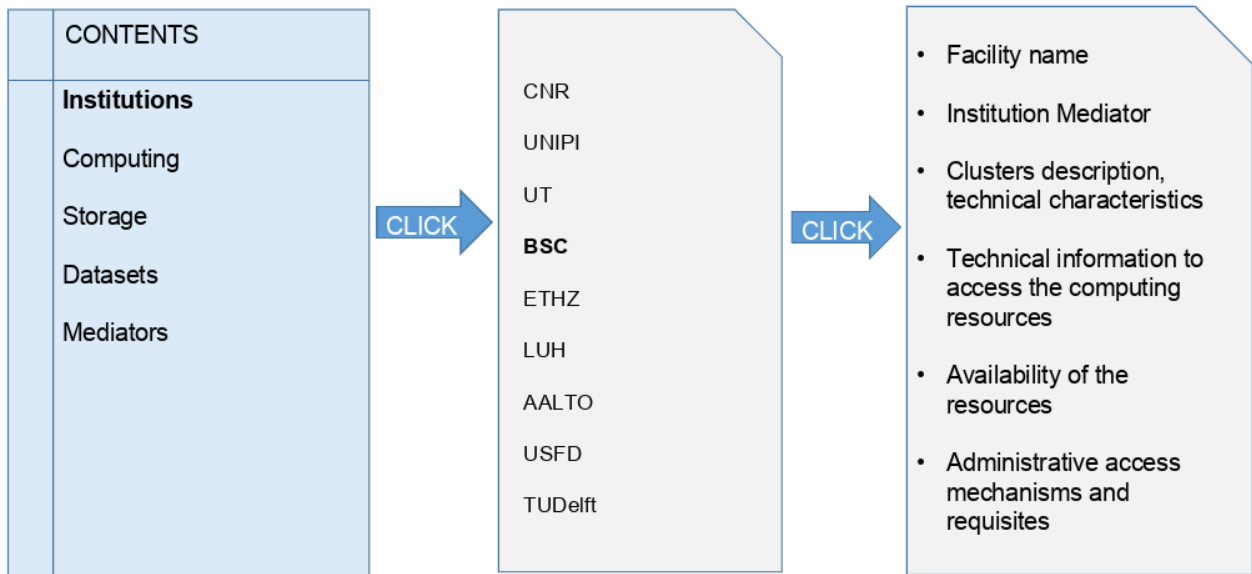

Figure 3.1.1 - Diagram 1: institutions tab view

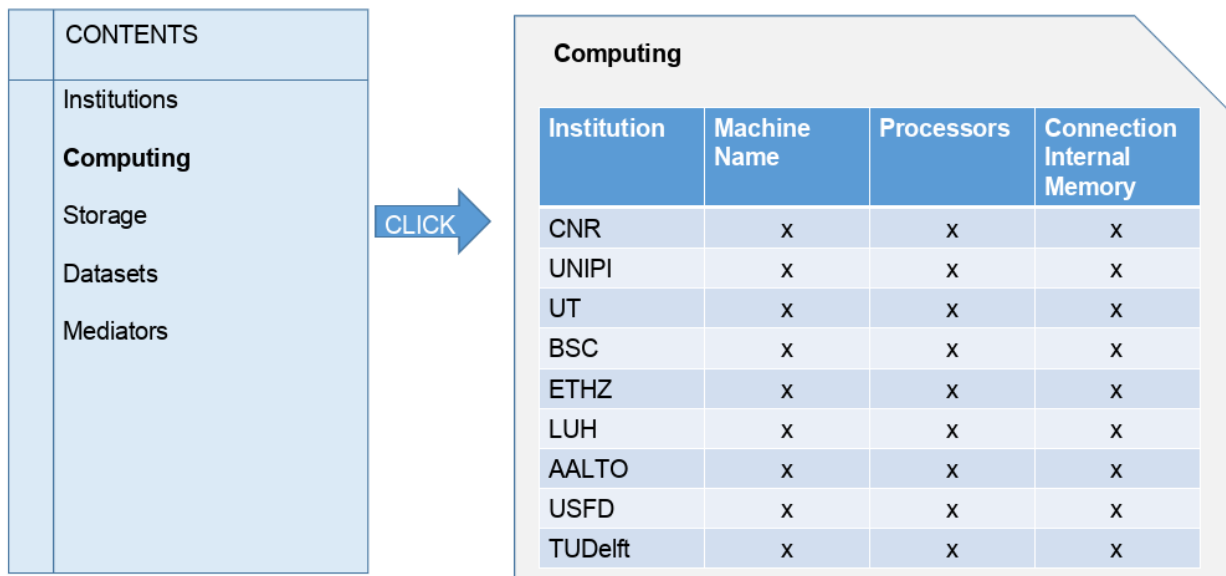

Figure 3.1.2 - Diagram 2: computing tab view

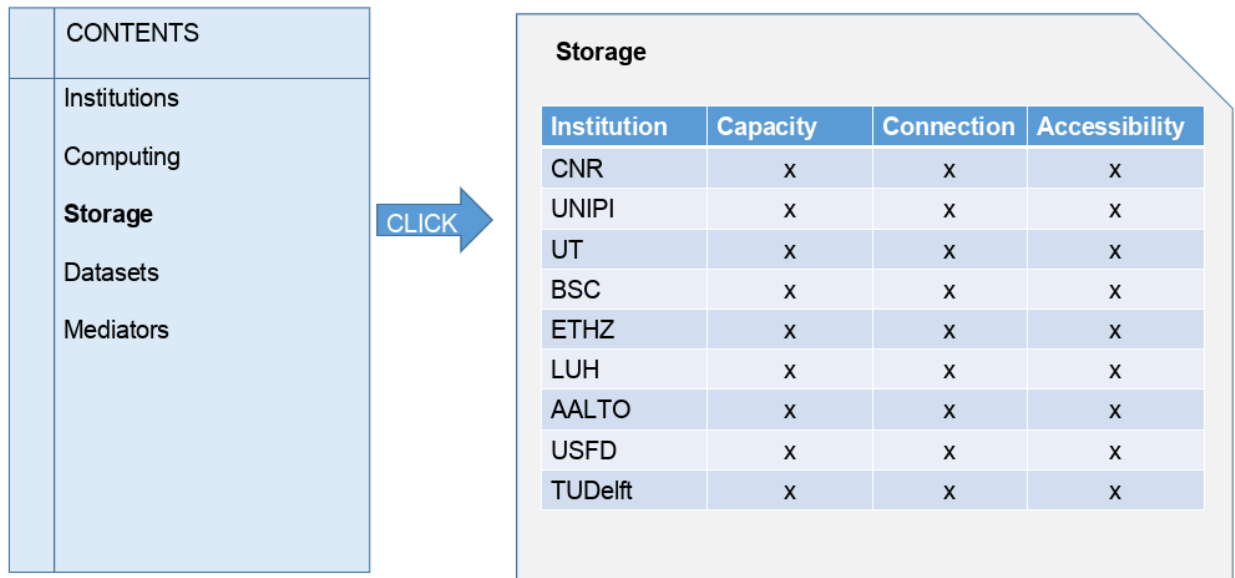

Figure 3.1.3 - Diagram 3: storage tab view

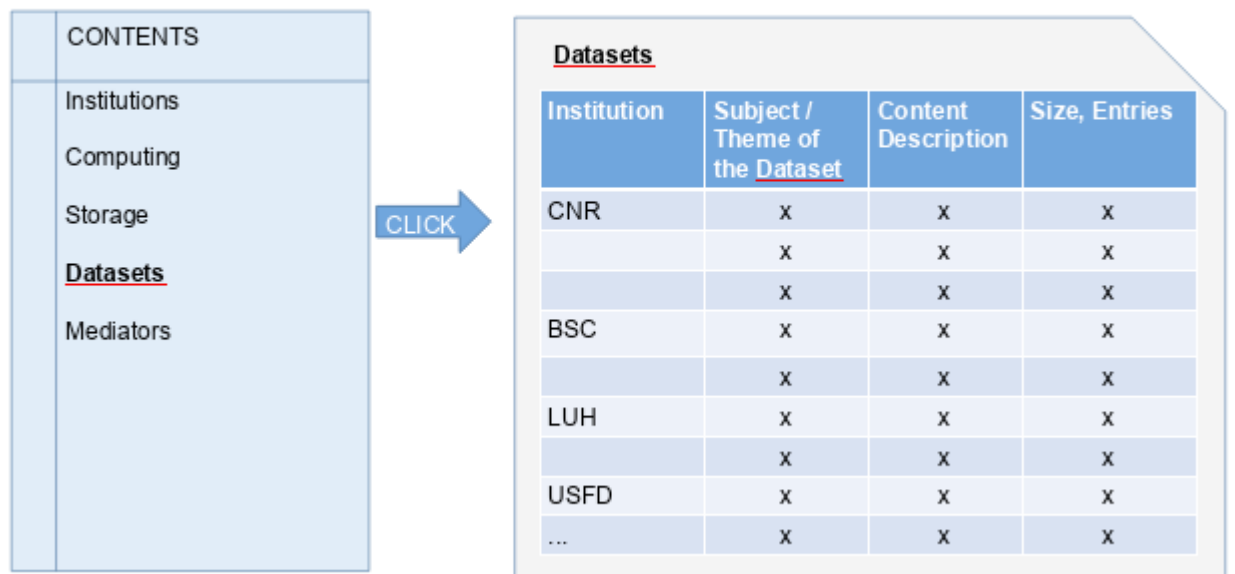

Figure 3.1.4 - Diagram 4: datasets tab view

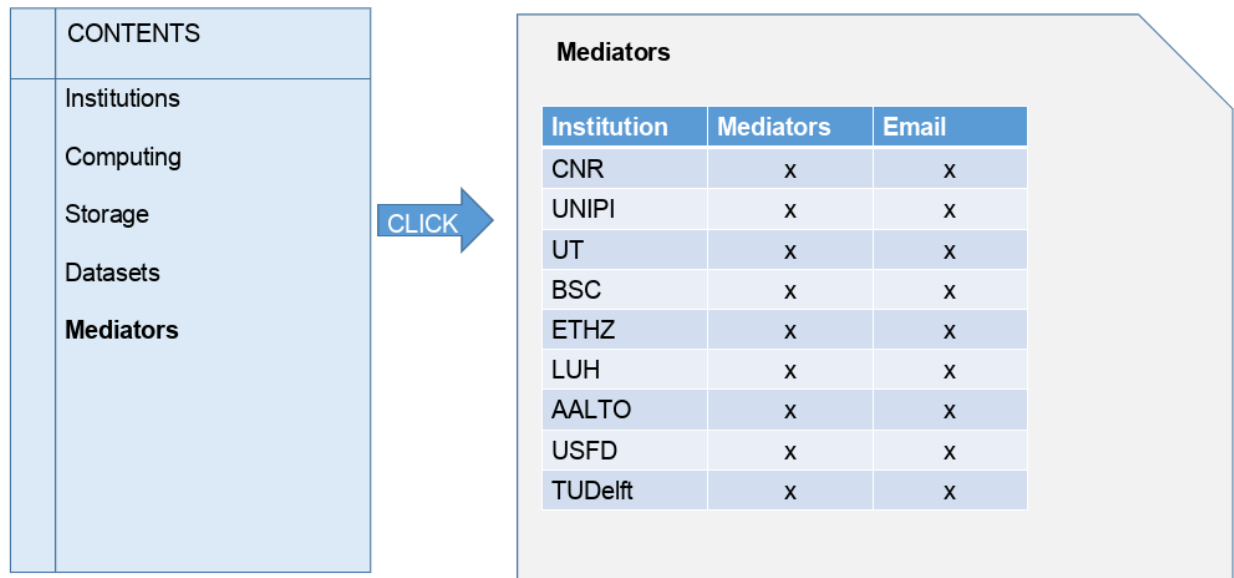

Figure 3.1.5 - Diagram 5: mediators tab view

4 Conclusions

The portal's objective is to support new users in finding the appropriate computational resources, facilitate matching resource availability and the user's needs, and facilitate the procedures to access the resources.

The objectives will be accomplished by creating a wiki in the already existing SoBigData++ gateway where the facilities' characteristics, availability of resources, administrative access mechanisms, technical information to access the computing resources, and the contact links to the institution mediators will be displayed.

The information contained within the wiki is of public interest and therefore needs to be publicly available without registration or login.

Once the wiki is deployed, the centre mediators will take charge of their own information update and, therefore, will need access to the wiki as editors. With such a system, we assure the content will be easily kept updated, without need of any technical intermediate.

The format and platform supporting the portal can be adapted and updated if the needs and objectives are not met, or the users will request changes or a different functionality in the future.
